

Common file formats, Part 1

FASTA/FASTQ

The FASTA file format

- Text-based format for representing
 - nucleotide sequence OR
 - peptide sequence (single letter codes)
- Each sequence in the file begins with a unique header line denoted with a “>”
- The following line(s) are sequence, typically between 60 and 130 characters in length (may include spaces and/or numbers)

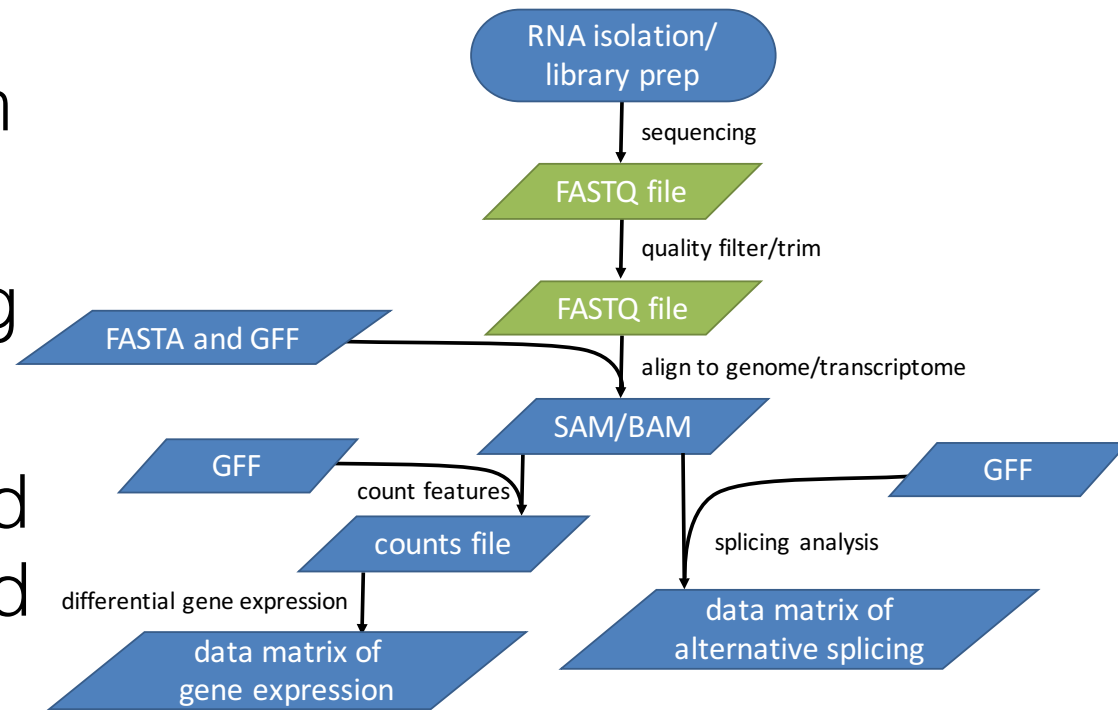

What does a FASTA file look like?

[illegible]

The FASTQ file format

- FASTQ is a modified form of FASTA
- Goal: include sequencing quality scores
- Has become the standard for storing data generated by NGS data
- To understand quality scores, it's helpful to understand how sequencing data are generated

Sequencing on Illumina's flow cell

Sequencing on Illumina's flow cell

Cluster Generation

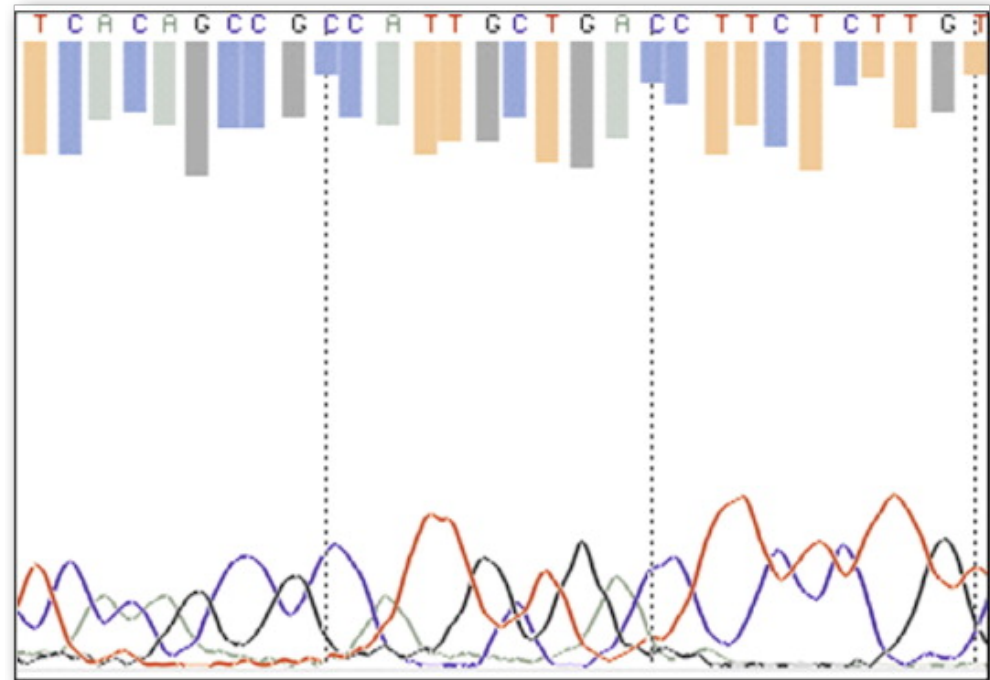

What does high/low quality data look like?

High quality data

Lower quality data

Each base call is given a score:
Phred quality score

Each base call is given a score: Phred quality score

Phred Quality Score	Probability of incorrect base call	Base call accuracy
10	1 in 10	90%
20	1 in 100	99%
30	1 in 1000	99.9%
40	1 in 10000	99.99%
50	1 in 100000	99.999%

What does a FASTQ file look like?

```
@NS500451:154:HWKTMBGXX:1:11101:10065:1121 1:N:0:TAGAACAC
AGGTTGCTATGAAATTTTAGTTGTCGTAGTAGGCAAACAATAAGGAATGTTGATCCAATAATTACATGGAGTCCATGGAA
+
AAAAAEEEA6EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
```

File uses four lines per read

1. Begins with “@” followed by unique sequence identifier
2. Sequence of the read
3. Begins with “+” and is optionally followed by identifier again
4. Encodes the quality scores (must be same length as line 2)

Notice phred scores encoded by a single letter – how can we decode?

First, decode ASCII
